

To:	Wellington Regional Council PO Box 11646, Manners St, Wellington 6142.
Submission on:	Proposed Plan Change 1 to the Natural Resources Plan for the Wellington Region pursuant to Clause 6 and Part 4 of Schedule 1 of the Resource Management Act 1991 (includes Freshwater Planning Instrument)
Date:	15 December 2023
Submission by:	Wairarapa Federated Farmers.
	David Hayes WAIRARAPA PROVINCIAL PRESIDENT Federated Farmers of New Zealand
Address for service:	Elizabeth McGruddy SENIOR POLICY ADVISOR Federated Farmers of New Zealand PO Box 715, Wellington 6140 P 0800 327 646 E emcgruddy@fedfarm.org.nz

Introduction

- Wairarapa Federated Farmers welcomes the opportunity to submit on Proposed Plan Change 1 (PC1) to the Wellington Region Natural Resources Plan (NRP). Our submission is made up of two parts – this PDF document and an attached Excel submission table. In considering our submission, please ensure both parts are read in their entirety.
- 2. Federated Farmers supports progressive improvement towards the health and well-being of waterbodies in Te Awarua-o-Porirua Whaitua and Whaitua Te Whanganui-a-Tara (the whaitua). We acknowledge the work of the two whaitua committees over many years to develop the objectives and recommendations for freshwater across the whaitua. We also acknowledge the work undertaken by Wellington Regional Council (the Council) to support improvements to water quality at a catchment level, working with communities and targeting specific actions that are known to 'make a difference'.
- 3. Federated Farmers generally agree with the long-term overarching objectives for both whaitua. We believe that 2100 is a realistic timeframe for those objectives, as many of the desired target attribute states (TASs) will take multiple generations and much planning and investment to achieve.
- 4. We support an interim timeframe of 2040 to 'check in' and see whether water quality is on a trajectory of improvement. However, we don't believe that all TASs will be able to be achieved by 2040, which is just 17 years away. In part this is because there is currently a lack of quality data to establish baseline positions for all TASs. More work needs to be done to gather and collate this data so it can be used to inform the freshwater action plans (FAPs) that will set out the pathway to achieving the TASs.
- 5. Quality data is also needed to inform models that are free of uncertainty and error to the extent that they can be used to underpin policies that drive system change. Federated Farmers is concerned that model outputs used for PC1 of the NRP are inadequate for this purpose. Any model is only as good as the quality of data used for inputs and must be ground-truthed. We don't believe that there has been sufficient effort put into ground-truthing the modelled data for PC1, and this should be a focus for the Council before some policies and rules can be proposed.
- 6. Federated Farmers is concerned to see 'blanket' policies and rules proposed that will be implemented at property level with severe implications for rural landowners, including requiring them to retire certain classes of land from pastoral and plantation forestry use and undertake expensive riparian management measures. We don't believe there is clear unequivocal evidence that supports these policies and rules, and/or that the proposed policies and rules will get us any closer to achieving the TASs.

- 7. The direct and opportunity costs of some of the proposed policies and rules are too high for rural landowners and amount to a form of 'managed retreat' for public good, with no compensation.
- 8. Federated Farmers contends that there is a better way forward. Council can be an "exemplar" on its own land and to other regional councils across New Zealand on partnering with landowners and rural communities to get serious about the smart data needed to inform best bang-for-buck policies that will enable it to achieve the long-term objectives.
- 9. Federated Farmers support an integrated catchment approach to the management of sediment and nutrient loss, supported in tangible ways by the Council and underpinned by non-regulatory methods such as FAPs and a Regional Forest Spatial Plan. We believe this approach provides an opportunity for the Council to demonstrate best practice in terms of management and protection of natural ecosystems including freshwater ecosystems.
- 10. Below we present our views on specific parts PC1 of the NRP (organised by topic). Our recommended relief is set out in the Excel table. We request that the Council make any consequential amendment(s) necessary to give effect to the relief sought by Wairarapa Federated Farmers.
- 11. At date of finalising this submission we are still waiting to receive information requested from Council. The information is potentially material to our relief and we propose including material received after the submission deadline in the upcoming hearings.

Target Attribute States and Timeframes

- 12. The overarching objectives in chapters 8 (WH.O1) and 9 (P.O1) are that waterbodies in the two whaitua will be wai ora by 2100. Objectives WH.O1 and P.O1 intend that the health of water bodies from now until 2100 should improve "progressively" to reach wai ora. Federated Farmers generally agrees with these overarching objectives, although we would like to see them include provision for a thriving primary production sector.
- 13. Objectives WH.02 and P.02 are clear that there will be a trajectory of measurable improvement towards the health and well-being of waterbodies and their margins in the whaitua, such that by 2040, listed processes or states in relation to freshwater have improved or have been reached. These objectives recognise that the enormous amount of system change needed to meet the overarching objectives of WH.01 and P.01 will take time (i.e. generations), knowledge that might not yet be available and significant financial investment to achieve.
- 14. Progress towards the overarching objectives will be measured by meeting proposed TASs and coastal water objectives. The Council has set out TASs that must be met by 2040 in Tables 8.4 and 9.2 of PC1, i.e. within the next 17 years.

- 15. Federated Farmers considers 2040 to be an unrealistic timeframe to meet all the proposed TASs. The notes in Tables 8.4 and 9.2 alone indicate that the Council has insufficient data on baseline states for some attributes and that further monitoring and modelling is required to develop attribute state frameworks. Further work is also required by the Council, with mana whenua and communities, to develop and implement a large number of FAPs to address how TASs will be achieved. This whole body of work will likely take time to establish a robust body of evidence for the TAS baselines, and the plans on how to achieve TASs where they need to be improved.
- 16. Federated Farmers supports progressive improvement towards the health and well-being of waterbodies in the two whaitua, but we think a requirement to achieve all the TASs by 2040 is unrealistic. Federated Farmers seeks that the reference to 2040 be removed from Tables 8.4 and 9.2. We believe where the TASs are already met, they should be maintained (this is a requirement under the NPS-FM in any case). Where they need to be improved, the tables should reflect realistic dates by which the TASs can be achieved.
- 17. Milestone target dates do not have to be the same for all TASs and all part FMUs. The Council has an opportunity to prioritise part-FMUs where it can achieve the 'easiest wins' (perhaps, for example, because work is already underway, or cessation of a single point source discharge could improve water quality dramatically) or where human health is most likely to be impacted by poor water quality. Realistic timeframes can be determined through the process of preparing FAPs and brought into a future version of the NRP through a variation.
- 18. Federated Farmers seeks relief that TAS's and/or sites where there is limited or 'insufficient data' should be removed from Tables 8.4 and 9.2 because the baseline state cannot be reliably determined, and therefore it is not known whether the attribute and/or site needs to be maintained or improved.

Management of Sediment

Sediment from land disturbances (earthworks and vegetation clearance)

- 19. The earthworks and vegetation clearance rules in the operative NRP were discussed extensively and agreed through Environment Court assisted mediation. The rules in the operative plan have been in place for a very limited time and were a significant shift on the previous plan. Federated Farmers contends that it is too soon to start unravelling the positions agreed through mediation, and that the operative rules should remain, so that the changes can be given time to take effect.
- 20. The operative plan had a permitted activity rule and a controlled activity rule for construction of new farm tracks (Rule R102 and Rule R103), both of which have been removed from the proposed NRP. This means that the construction of farm tracks is proposed to be a restricted discretionary activity or non-complying activity if the conditions of the permitted activity rule cannot be met. We see no reason why the permitted activity rule and controlled activity rule for construction of farm tracks have been removed, especially as the conditions for both rules

were very prescriptive (and most probably very effective) in terms of managing environmental effects. Federated Farmers opposes the removal of these rules and seeks to have them reinstated.

- 21. Earthworks from 1 June to 30 September each year is no longer a permitted activity, irrespective of whether the effects of the earthworks can be managed to meet the discharge standards (unless it has been anticipated in a certified farm environment plan (FEP)). Earthworks over the winter months of the year will now require a consent, with the application to be assessed as a non-complying activity (meaning it will have to meet the 'Gateway' test of s 104D of the RMA). Federated Farmers is concerned to see the implementation of a draft 'blanket ban' on earthworks for four months of the year, especially as it reduces a farmer's ability to manage and operate their business without additional cost and administrative burden and respond to events in a timely manner. For example, storm events over the winter months can wash out farm tracks, meaning farmers might not be able to access stock or farm buildings or sometimes even their own dwelling. Farmers need the flexibility to be able to restore access without having to wait for a resource consent to be granted.
- 22. In summary, Federated Farmers oppose the earthworks and vegetation clearance policies and rules in the proposed NRP and seek relief that the policies and rules in the operative NRP remain.

Sediment from pastoral farming

- 23. New maps for high and highest erosion risk land are proposed to be included in PC1 of the NRP. The Council considers that it is necessary to impose a policy that establishes permanent woody vegetation cover on at least 50% of highest erosion land (pasture) that is in pasture on a farm within 10 years and 100% by 2040 to meet TASs for sediment. The policy will apply to properties 20ha or more and will have the most impact in the Te Awa Kairangi rural streams and mainstreams FMU, and the Parangārehu catchment streams and south-west coast rural streams freshwater management unit (FMU).
- 24. Regarding modelling to identify highest erosion risk land (pasture) and high erosion risk land (pasture) we note the advice of Easton et al¹ that the mapped risk areas should not be used exclusively as the basis of management and investment decisions, and do not replace the need for site specific field assessment (i.e. ground-truthing) and expert advice. Easton et al also acknowledge other limitations with the modelling, including that underlying rock type has not been considered in the assessment of shallow landslide risk, nor have already-implemented erosion control measures such as established pole planting or sediment retention bunds been accounted for in the current iteration of the risk layers.
- 25. Federated Farmers has serious concerns about the erosion risk land modelling and how the Council intends to use it to underpin policies to retire land from pasture and plantation forest.

¹ Easton, S., Nation, T., Blyth, J. (2023) Erosion Risk Mapping for Te-Awarua-o-Porirua and Te Whanganui-a-Tara. Collaborations 15 pp.

We agree with Easton *et al* that site-specific assessments must be undertaken to ground-truth the model. Our members have told us that many areas of farms identified as being high or highest erosion risk land are stable and not erosion prone.

- 26. Federated Farmers considers that the policy to require the establishment of permanent woody vegetation cover on at least 50% of highest erosion land (pasture) that is in pasture on a farm within 10 years and 100% by 2040 to be overly onerous to landowners and extremely impractical to implement. This policy is essentially a policy of managed retreat to attain a public good by privatising the cost to individual property owners and is a major intrusion into private property rights.
- 27. The policy also creates an equity issue, as proposed policies and rules in urban areas of the whaitua generally apply at a municipal level (that is, they don't directly impact individual households or businesses), and costs can be debt funded across multiple generations of ratepayers. In comparison, policies and rules proposed for rural areas of the whaitua impact individual landowners with considerable costs being incurred within the next 17 years (i.e. less than one generation).
- 28. The policy might be palatable to some landowners if the timeframes were extended to a reasonable period and landowners were able to take advantage, in a voluntary capacity, of full compensation for areas of their land that would no longer be available for farming. It is noted that the policy prohibits even the establishment of production forestry on this land, further reducing options for economic use for landowners. The adoption of this policy will affect the on-farm income of landowners through the opportunity cost from foregone pasture production, and will also likely impact property values, making it harder for these properties to be sold and reducing their sale price.
- 29. Evans et al² explore the issue of compensation where changes to legislation or policies deprive members of society some right or freedom, such as the use of their property to provide for their economic well-being. They argue that where a specific government decision or change in policy denies the owner of property the ability to make an economically viable use of that property in the use for which it was purchased, then this represents a de-facto taking [of private property rights] that requires compensation.
- 30. Farmers will be required to pick up the costs of fencing, pre-planting preparation of land, purchase of seedstock, planting, watering, fertilising and weed and pest control. There are likely to be considerable challenges sourcing sufficient seedstock for planting and finding labour to plant native seedstock. A further challenge and cost is likely to be sourcing specialist advice to ensure new plantings occur in a way that is consistent with the Emissions Trading Scheme (ETS) eligibility criteria so as to avoid plantings being ineligible for New Zealand Units (NZUs).

² Evans and Quigley - Protection of private property rights and just compensation - 27 Oct 2009 - Background Reading for the 2025 Taskforce - New Zealand (treasury.govt.nz)

31. The policy mentions, rather vaguely, that WRC will provide "support" to landowners to implement erosion risk treatment plans. The level of support is not detailed, but if it is fair and comprehensive it is likely going to be costly for ratepayers. Federated Farmer's view is that the support of landowners (i.e. financial compensation for the loss of production, the costs associated with planting land in permanent forest and ongoing maintenance of those areas) is of such importance that it deserves a policy that is explicit in the extent, timing and delivery of such assistance and includes a full buy-out option.

7

- 32. The Council states in the s32 report that the separation of highest erosion risk land and soil conservation treatment of high erosion risk land may provide for minor increases in productivity from the farm, as the more productive areas are separated from less productive areas, allowing for increased production on the better suited land. This argument has no rational basis and ignores the Council's other policies which cap nutrient discharges from farming activities, effectively limiting any further intensification.
- 33. Federated Farmers acknowledges that the area (ha) of land within the highest erosion risk land map is relatively small across the two whaitua; however, at a farm scale the areas are significant for some properties. We have heard from members who estimate they could lose at least a third of their property under this policy.
- 34. Federated Farmers oppose policies and rules that require the 'blanket' mandatory retirement of private land to manage potential sediment loss. We suggest an alternative approach that was discussed in Hearing Stream 3 Climate Change: Climate Resilience and Nature-Based Solutions for Plan Change 1 to the Regional Policy Statement in June 2023. Specifically, that restoration and enhancement of the natural ecosystems is best achieved via non-regulatory incentives and support.
- 35. The 42A officer (Pam Guest) for Hearing Stream 3, in her s42A report³, noted that <u>regional</u> <u>plans cannot require landowners or others to plant forest or restore and extend wetlands.</u> Ms Guest proposed that Method CC.4: 'Prepare a Regional Forest Spatial Plan' use a partnership approach, with mana whenua and other key stakeholders, to identify where to promote and support planting and natural regeneration of permanent forest and associated browsing pest animal control, including how to give effect to Objective CC.5 and address contribute to achieving water quality targets for sediment, to inform the requirements of Policy CC.6.
- 36. Ms Guest recommended that the Regional Forest Spatial Plan include:
 - a. a target for an increase in permanent forest extent in the Wellington Region to support achieving Objective CC.5,
 - b. evaluation of the potential impacts of increased afforestation on rural production and social wellbeing, and development of an approach that will maximise the environmental, social, and economic benefits,
 - c. ways to implement and support capability for increasing the area of indigenous forest, including the provision of incentives,

³ <u>s42A (wrc.govt.nz) page 90</u>

- d. identification of the types of indigenous forest to prioritise for re-afforestation, including links to the strategic indigenous biodiversity targets and priorities identified through Policy IE.3 and Method IE.3, and
- e. a process to monitor and report on changes in the extent and health of permanent forest.
- 37. Federated Farmers support an integrated catchment approach to the management of sediment loss, supported in tangible ways by the Council and underpinned by non-regulatory methods such as FAPs and a Regional Forest Spatial Plan. We believe this approach provides an opportunity for the Council to demonstrate best practice in terms of management and protection of natural ecosystems including freshwater ecosystems. The Council can use their own farmland as an exemplar to communities and develop, in partnership with private landowners, innovative solutions to targeted at-risk areas.
- 38. Federated Farmers is very concerned about the dSedNet modelling to estimate the sediment load reductions required from catchments to meet the TASs for visual clarity. We believe there is too much model uncertainty and error for the model outputs to be used as a basis for policy decisions that will have drastic impacts on farming businesses. Greer et al⁴ discuss limitations with the modelling and caution that *reported sediment loads should… be viewed as estimates only.*
- 39. The sediment load reduction modelling relies on data that is spatially and temporally very limited. Water quality monitoring sites, especially for Te Awarua-o-Porirua⁵ are few in number. The proportional change in sediment load required to meet visual clarity targets in Te Awarua-o-Porirua was estimated using data from just three sites (Horokiri Stream at Snodgrass, Pāuatahanui Stream at Elmwood Bridge, and Porirua Stream at Milk Depot). According to Greer et al, there are three autosampled sites in Te Awarua-o-Porirua, but data from these was not included in the modelling.
- 40. Each monitoring site is used to gather water quality data water for large areas of land. For example, the Mākara Stream at Kennels monitoring site is used to determine water quality for 7203 ha, and Mangaroa River at Te Marua is used to determine water quality for 10,370 ha. Obviously, one monitoring site for such a large area of land cannot be expected to yield data that is 'representative' of all waterbodies within that area.
- 41. Data from monitoring sites is from grab samples taken once per month. Greer et al note that the data collected has a limited number of event-based flows, which would be expected with infrequent sampling. The modelling uses median clarity calculated from data collected over five years (2016 2021) and also uses previous modelled average annual loads for baseline state as a key input. Further issues with the data are that flow recorder sites do not always match the monitoring sites where clarity measurements are taken.

⁴ <u>Greer-M.J.C.-Blyth-J.-Eason-S.-Gadd-J.-King-B.-Nation-T.-Oliver-M.-Perrie-A.-2023.-Technical-assessments-undertaken-to-inform-the-target-attribute-state-framework-of-proposed-Plan-Change-1-to-the-.pdf (gw.govt.nz)</u>

⁵ There are five monitoring sites in TAoP and 18 monitoring sites in TWT according to Greer et all Table 36.

- 42. The Ministry for the Environment (MfE) note in the Guidance for Implementing the NPS-FM Sediment Requirements⁶ that errors and uncertainties within a model propagate at each step in the modelling process. A small error in input data can snowball into a substantial error in outputs. MfE highlight that there are considerable errors in load estimation from monitored water quality and flow data, particularly where water quality data is restricted to monthly grab samples and may not represent the full range of flows. MfE's advice, as a key recommendation, is to improve the current level of sediment monitoring and to collect flow data concurrently at sediment monitoring sites.
- 43. MfE acknowledge that current knowledge on the effectiveness of erosion control measures to reduce sediment loads is imperfect. A 2020 report prepared for the Council⁷ by Aquanet Consulting Limited describes the work an expert panel undertook for the Council to compare water quality and ecology effects under climate change and across three different management scenarios. The scenarios were BAU (the current regulatory and management approach), Improved (a significant step up in effort across several aspects of both urban and rural land and water management) and Sensitive (a further step up in effort to fully incorporate numerous water sensitive urban design and rural land and water management methods). The expert panel assessed and documented their relative level of confidence on predictions as to the efficacy of the three scenarios on water quality and ecology attributes. The report notes, very deliberately, that the expert panel generally had a low-level of confidence in their assessments of how sediment input will change under the different scenarios, as they were primarily based on the modelled effects of climate change on flow which is subject to a high degree of uncertainty.
- 44. The Aquanet report was part of the information considered by Te Awarua-o-Porirua whaitua committee in making their recommendations on policies. The committee recognised that uncertainties in the information available warranted caution against recommending load reductions at a catchment-scale⁸.
- 45. Federated Farmers seeks relief that the Council improve the quality and quantity of their monitoring data to inform the dSedNet modelling before any changes to policies and rules in the NRP are made. We note that clause 1.6(2)(b) of the NPS-FM requires councils to take all practicable steps to reduce uncertainty. Clause 1.6(1) requires councils to use, if practicable, complete and scientifically robust data. Federated Farmers contends that the data used to model the sediment load reductions is neither complete nor scientifically robust and is totally inadequate to underpin significant shifts in policy that have severe consequences for rural landowners.

Sediment from Plantation Forestry

46. Many farmers in the Greater Wellington area have land planted in plantation forestry, as a long-term investment and recognising that some land use capabilities (LUCs) are more

⁶ <u>Sediment-ME1663-Final-1.9.pdf (environment.govt.nz)</u>

⁷ Whaitua-Te-Whanganui-a-Tara-Water-Quality-and-Ecology-Scenario-Assessment.pdf (gw.govt.nz)

⁸ PC1 NRP s32 report, at page 52

suitable for forestry than pastoral/ arable farming. In fact, farmers have been encouraged to plant production forests through government and regional policies over many years. Policy WH.P28 and Rule WH.R22 seek to reduce sediment discharges by requiring that on highest erosion risk land (plantation forestry), plantation forestry is not established or continued beyond the harvest of existing plantation forests. This is a draconian approach that ignores technology advances that forest harvesters have made and will continue to make to harvest practices (such as the use of haulers rather than skidders, removal of slash from skid sites, limits to the area that can be harvested over certain periods of time, retaining a riparian margin around harvested areas and stream boundaries etc).

- 47. The policy is another example of 'managed retreat' for public good, with all the cost being borne by the landowner. Similar to the conversion of pastoral land to permanent forest, there are likely to be considerable challenges sourcing sufficient seedstock for planting and finding labour to plant native seedstock. There will be cost associated with sourcing specialist advice to ensure new plantings occur in a way that is consistent with the Emissions Trading Scheme (ETS) eligibility criteria to avoid plantings being ineligible for New Zealand Units (NZUs).
- 48. The conversion of exotic forest to permanent forest presents several difficulties in relation to the ETS. Specifically, these are:
 - a. Uncertainty around how the ETS treats the transition of registered exotic forests to native forest species,
 - b. Uncertainty around how averaging accounting would address a new planting rotation occurring on a very different basis to when the forested area was originally registered in the ETS
 - c. Uncertainty around the sequestration rates of native species (this work is still in its infancy and may need 5-6 more years to produce anything of any use)
 - d. Uncertainty around the possibility of needing to first de-register the exotic forest (and paying back all the NZUs earned from it) before registering the native forest as a new forest.
- 49. Federated Farmers would like to see this policy amended to enable the replanting of production forests so long as landowners can identify (through a consent application) how the management and harvest of the forest will be achieved without adverse effect on sediment in waterbodies.

Riparian Management (Stream Shading and Livestock Access to Small Rivers)

50. Federated Farmers is generally supportive of efforts to promote the progressive shading of streams, if landowners are supported with financial assistance to fence, plant and maintain plantings and the width of the plantings is reasonable⁹.

⁹ A review of the statistical relationship between set-back width and instream sediment reduction identified the sediment removal efficiencies for setbacks of 1 metre, 3 metres, and 5 metres are (in percentages) 15, 34, and 46 respectively. From: Sweeney, B.W., Newbold, J.D. (2014) Streamside Forest Buffer Width Needed to Protect Stream Water Quality, Habitat, and Organisms: A Literature Review. JAWRA Journal of the American Water Resources Association, 50(3): 560-584. 10.1111/jawr.12203

- 51. However, it should be noted that in the short term (circa 20 years), stream shading may not be a sediment control measure that assists the Council in its trajectory to meeting proposed TASs. This is because shade from dense planting can cause the loss of undergrowth and bankarmouring vegetation, such as grasses, leading to a transient phase of increased bank erosion in small streams as the stream channel widens. The loss of undergrowth can also lead to sheetwash and rilling, which can further increase sediment loads. ¹⁰ Sediment related water quality following riparian planting is likely to get worse before it gets better as stream banks erode and channels widen in response to increased tree shade¹¹.
- 52. Objectives in the proposed NRP require that by 2100, all freshwater bodies have planted margins. Taken at its literal reading, this would mean every stream, river, lake, wetland and spring within the Waitua would have to be planted, including urban water bodies. Whilst this is aspirational, and may eventually contribute to better water quality, it is not practical or even possible to plant every stream margin (for example where topography doesn't allow for a riparian margin).
- 53. According to the s32 report, excluding stock from small streams (<1m) within the Mangaroa River and the Mākara Stream catchments will *likely* make an important contribution to addressing water quality issues, specifically visual clarity which is below the national bottom line and *E. coli* which is below the TAS. This may be true, but in reality there has been very little research done in New Zealand on the effectiveness of riparian management measures to reduce stream bank erosion^{12.} Importantly, Hughes (2016) notes that a one size fits all approach to riparian management measures to reduce stream bank erosion is unlikely to be appropriate or effective.
- 54. This is the sort of knowledge that must be considered in the preparation of FAPs to address interim and long-term priorities, including attaining the national bottom lines for TASs, and what can realistically be achieved by interventionist policies.
- 55. The s32 report links stream shading policies to the management of periphyton growth. Federated farmers notes than in nearly all part FMUs the Council has insufficient data on periphyton biomass. We suggest the Council undertake further monitoring to understand periphyton growth characteristics in the region. We support the Council's intention to address periphyton growth in specific 'hot spots' through FAPs.

Management of Nutrients

Small Farms

- 56. Method M42 requires properties between 4ha and 20 ha and where winter stocking rate is greater than 12 stock units per hectare to be registered with the Council, despite the Council having no evidence that small properties make a meaningful contribution to catchment-scale nitrogen (N) losses. It's difficult to understand what problem the Council is trying to solve with its approach to nutrient management for sites under 20 hectares in the two whaitua. The s32 report infers that there must be something to manage, because these properties are generally on better quality land that could (theoretically) support more intensive land use. However, the Council presents no sound evidence that there is any issue with nutrient losses from small farms, or that their recommended policies and rules are necessary.
- 57. Registration of these properties, and annual assessments of N loss risk will create a needless administrative burden for small property holders and the Council. Failure to comply with the requirement for annual nitrogen discharge risk assessments for these parcels will needlessly trigger requirement for resource consent, with associated costs for landowners and burden for the Council, for what amounts to little or no environmental benefit. The quality of data from the annual assessments, which Federated Farmer's understands will be a 'simple online tool' (Gerard Willis *per comm* 4 December 2023) may be low, and therefore of limited use, without a full range of relevant input data and interpretation.
- 58. Moreover, strict N loss management is unnecessary because nitrogen is not a significant problem in the region's freshwater bodies to begin with. The Council's own attribute state baselines show that river and stream surface water bodies are almost all within the NOF 'A' Band for nitrate and ammonia toxicity under the National Policy Statement for Freshwater Management (2020) (NPS-FM), with a relatively small number of sites in the 'B' Band and lakes in the 'B' and 'C' Bands. There are no freshwater bodies in rural areas with attribute states in the 'D' or 'E' Bands for nitrogen related attributes.
- 59. Federated Farmers opposes the requirement for all small farms between 4ha and 20 ha to register with the Council, and to prepare an annual nitrogen risk loss assessment. We consider that these requirements provide no environmental benefit, are an unnecessary burden for small block owners, and provide little or no meaningful data for the Council.

Properties greater than 20ha

60. The generally low N concentrations throughout the rural areas of the two whaitua are partly due to the type of farming that is predominant in the catchments. Most pastoral farms are mixed sheep and beef farms and are not intensively farmed. These properties typically have a lower N footprint than other types of farming and the risk of dissolved inorganic nitrogen (DIN) polluting waterways is very low.

61. The s32 report articulates that hill country farms in the two whaitua apply little, if any nitrogen and overall, stocking rates are very low. Even though monitoring shows that river and stream surface water bodies are almost all within the NOF 'A' Band for nitrate toxicity and ammonia toxicity, the Council's proposed policies are to manage N loss reductions by land retirement and destocking (as a response to the need to reduce sediment loss).

Take and Use of Water - Te Awarua-o-Porirua Whaitua

Permitted water takes

62. The Council has limited information on what proportion of water abstraction is taken under the current permitted activity rules or is authorised under s14(3)(b) of the RMA. Federated Farmers supports the recommendation of Thompson¹³ that periodic surveys be conducted to gather more information on these takes as and when required (for example, to coincide with catchment-wide expiry of consented takes). This is a much more pragmatic approach than requiring metering for every permitted water take, which would be unduly costly for water users to implement and for the Council to administer.

Water allocation (consented takes)

- 63. In the Porirua, Pāuatahanui and Horokiri catchment management units, the allocation limits and minimum flows are proposed to be expressed as specific numbers rather than default percentages of mean annual low flow (MALF) as set out in operative policies of the NRP. Federated Farmers support this change, as it makes it clearer for water users and Council staff what the limits are.
- 64. For Porirua, Pāuatahanui and Horokiri catchment management units, a Restricted Discretionary Activity rule is proposed for takes that are not otherwise permitted or controlled, and which meet the minimum flow requirements and allocation limits. The Controlled Activity rule (Rule R157) for the take and use of water in the operative NRP is proposed to be removed for Te Awarua-o-Porirua Whaitua. We question why takes that meet the minimum flow requirements and allocation limits should be classified as Restricted Discretionary, as proposed in PC1. In our view, takes that meet minimum flow requirements and are within allocation limits should be assessed under a Controlled Activity rule, which would provide more certainty for water users and would be less expensive for the Council to administer.
- 65. All allocation limits in the Te Awarua-o-Porirua Whaitua (both specified and default) are proposed to be based on 20% of MALF, rather than 30% as in the operative NRP. The Te Awarua-o-Porirua Whaitua Committee considered the allocation limits of streams in the whaitua in detail¹⁴ and were advised that a minimum flow of 90% of MALF and an allocation limit of 30% of MALF (90 + 30) was at the environmentally conservative end of the spectrum,

¹³ <u>Thompson-M.J.-2023.-Plan-Change-1-Te-Awarua-o-Porirua-Water-quantity-and-allocation-technical-report.pdf (gw.govt.nz)</u>

¹⁴ Te-Awarua-o-Porirua-Whatiua-Implementation-Programme.pdf (gw.govt.nz)

meaning the limits provide well for the ecological health, habitat space and mahinga kai species such as the taonga species tuna (longfin eels). The whaitua committee were advised that the 90 + 30 approach gave good levels of habitat protection of between 90% and 98% habitat protection for native fish species at minimum flow¹⁵. The committee considered other allocation limits (including 20% of MALF) but agreed that the status quo allocation limit of 30% should remain (recommendation 68).

- 66. The subsequent proposal by Council staff to amend the allocation limit to 20% of MALF appears to be a 'nod' to the revised NPS-FM 2020, in particular the hierarchy of Te Mana o Te Wai. According to Thompson¹⁶ the whaitua committee might have adopted a more precautionary approach had the hierarchy of Te Mana o Te Wai been in place at the time of their considerations (as to this, we will never know). In setting aside the recommendation of the committee, the Council has relied on advice from Cawthron Institute¹⁷. Cawthon's advice was based on default minimum flow and allocation limits originally recommended for streams and rivers in Otago and later recommended for Greater Wellington.
- 67. Policy P.P32 of PC1 applies an allocation limit of 20% of MALF to all waterbodies in the Porirua whaitua including rivers, and category A and B groundwater (stream depletion). Thompson considers this to be a more 'precautionary' approach and more aligned with Te Mana o Te Wai.
- 68. The concept of Te Mana o te Wai, at clause 1.3 of the NPS-FM, refers to the fundamental importance of water and recognises that protecting the health of freshwater protects the health and well-being of the wider environment. It protects the mauri of the wai. However, the concept also refers to restoring and preserving the balance between the water, the wider environment, and the community.
- 69. The National Objectives Framework (NOF) guidelines state that the reference to 'balance' isn't intended to signal a trade-off between Te Mana o te Wai and other goals. It emphasises that healthy freshwater is a prerequisite for a healthy wider environment and community, and that it is vital to keep those elements in balance.
- 70. Federated Farmers considers that the whaitua committee did a good job of considering the balance between ecosystem health and mahinga kai and economic use of water when they made their recommendation to retain the 90 + 30 approach to minimum flow and allocation amounts. The committee were entitled to rely on advice that the approach was environmentally conservative and would provide habitat protection of between 90% and 98% habitat protection for native fish species at minimum flow. They determined that the

¹⁵ <u>Water-allocation-alternative-levels-of-minimum-flow-and-allocation-limit.pdf (gw.govt.nz)</u>

¹⁶ <u>Thompson-M.J.-2023.-Plan-Change-1-Te-Awarua-o-Porirua-Water-quantity-and-allocation-technical-report.pdf (gw.govt.nz)</u>

¹⁷ Shearer K and Hayes J 2021. Environmental flows and allocation investigations for small streams in the Greater Wellington region. Prepared for Greater Wellington Regional Council. Cawthron Report No. 3674. 66 p. plus appendices.

approach would provide good protection for ecosystem health and moderate reliability for both supply and availability of water.

71. Federated Farmers supports the recommendation of the whaitua committee, who we believe made their recommendation on the basis that the 90 + 30 freshwater management framework would protect ecosystem health whilst providing for the needs of the community. Accordingly, we seek relief that the allocation limit for freshwater bodies in Te Awarua-o-Porirua Whaitua be returned to 30% of MALF.

Freshwater Action Plans

- 72. Federated Farmers supports the development and use of Freshwater Action Plans in principle. We note that the s32 report states that *the involvement of communities and institutional stakeholders in action planning is welcomed but it is not considered appropriate to direct partnerships through Plan Change 1* and that *the key partnership Council is wishing to prescribe in PC1 for freshwater action planning is the Council's treaty partnership with mana whenua.*
- 73. Whilst acknowledging the importance of the Council's partnership with mana whenua/ tangata whenua, there is ample evidence that the engagement of the community (as a whole) confers legitimacy upon planning and decision-making processes¹⁸. The NPS-FM also recognises the importance of community engagement within the fundamental concept of Te Mana o te Wai (clause 1.3(1)), within the hierarchy of obligations of Te Mana o te Wai (clause 1.3(5)), within the Part 2 objective of the NPS, and elsewhere (e.g., Policy 5 and Policy 15 of clause 2.2).
- 74. In November 2023, the 42A officer for PC1 of the Regional Policy Statement Plan Hearing Stream 5 (Freshwater) recommended changes to Method FW.1: of the Wellington Regional Council Regional Policy Statement (RPS) as follows:

Prepare Freshwater Action Plans in partnership with mana whenua / tangata whenua, <u>and</u> <u>through engagement with communities</u>, <u>stakeholders and territorial authorities</u>, as required by the NPS-FM to contribute to achieving the target attribute states set in the NRP.

75. This change was supported by Federated Farmers as it gives effect to the NPS-FM (clause 3.7(1)(a)). The RPS wording should align with the wording in Methods M36 - 41 of the proposed NRP in relation to the development of FAPs. The involvement of communities, stakeholders and territorial authorities in the development of FAPs is especially important as the s32 report¹⁹ acknowledges that achieving 12 of the 321 TASs across the two whaitua will require actions in addition to those currently contemplated, and that the nature and scale of

¹⁸ Rijal, S. (2023). The importance of community involvement in public management planning and decisionmaking processes. *Journal of Contemporary Administration and Management* Vol1 Issue 2 August 2023 pp 84-92.

¹⁹ <u>Proposed-Plan-Change-1-Section-32-report.pdf (gw.govt.nz)</u> page 6.

these additional methods will be determined through the action planning processes after the plan-making process has been completed.

- 76. Federated Farmers notes that there are 72 triggers for FAPs across both whaitua. Addressing these triggers through the FAPs will be a lot of work for the Council, mana whenua and communities. We seek relief that the urban FAPs be completed by the end of 2026 and that rural FAPs be completed by the end of 2027.
- 77. Federated Farmers believes that the FAPs should be targeted to catchment-scale actions. We have concerns that the boundaries for the part-FMUs may need refining for the purposes of managing water quality in both rivers and receiving environments (e.g. harbours). For example, we understand that some part-FMUs have catchments that drain in different directions.

Farm Environment Plans

- 78. Federated Farmers note that FEPs are referenced multiple times throughout PC1. Schedule 36 sets out the requirements for FEPs and references the certification requirements under the Resource Management (Freshwater Farm Plans) Regulations 2023. We suspect that the Council is using the term FEP interchangeably with the nationally mandated FWFP. Federated Farmers recommend that Council amend references to FEPs in the proposed NRP to FWFPs for consistency, and to avoid 'double-up' (two separate plans being required for the one property) and confusion.
- 79. According to Policy WH.P24 and Policy P.P21, FEPs have to be prepared and certified by 30 June 2027 for part FMUs where suspended fine sediment has a baseline state of D and/or where dissolved inorganic nitrogen is shown as being in need of improvement. Table 8.6 states that FEPs for Te Awa Kairangi rural streams and rural mainstems Parangārehu catchment streams and South-West Coast rural streams and Wainuiomata rural streams must be completed by 30 December 2025 and FEPs for Te Awa Kairangi lower mainstem Korokoro Stream must be completed by 30 December 2026. Table 9.5 states that FEPs are due 30 December 2025 for Taupō and Takapū part FMUs, and 30 December 2026 for Pouewe and Wai-O-Hata part FMUs.
- 80. Currently, the Wellington region has not been included in a national timetable for the roll-out of the nationally mandated FWFPs. The roll-out began in Waikato and Southland in August 2023. The next areas identified in the roll-out are Manawatu/ Whanganui, Otago and the West Coast, in early 2024. It is expected that the full roll-out will be complete by the end of 2025, with Wellington as one of the last regions to 'push go'²⁰. Farm operators will have 18 months from the date the regulations are 'turned on' in their region to prepare their first plan for certification. In effect, this means that the earliest that FWFPs are likely to be required in the Wellington region is mid-2027.

²⁰ Freshwater farm plans | Ministry for the Environment

- 81. Farm operators in the region are required to have regard to catchment context information (catchment context challenges and values CCCV) when preparing their FWFPs, information that the Council is required to collate under Clause 46 of the Resource Management (Freshwater Farm Plans) Regulations 2023. As well as collating the information, ground-truthing it with farmers, and publishing it, the Council needs to be confident that certifiers and auditors understand the catchment context information before appointing them to work in the region²¹. This is an extensive body of work for the Council, and it should be done before farm operators are required to prepare their first FWFPs.
- 82. Table 8.4 and Table 9.2 (Target Attribute States) show that the worst water quality in the two whaitua is generally in urban catchments. In both whaitua, *E.coli* exceedances present the greatest challenge to achieving the Plan's objectives, and in our view, the focus of effort should be on rules and methods in the urban catchments to address the gross exceedances of the NOF numeric states for this attribute. Addressing the *E. coli* exceedances as a high priority gives effect to the hierarchy of Te Mana o te Wai, as the presence of E. coli infers risk of campylobacter bacteria in drinking water (human health).
- 83. In summary, whilst Federated Farmers support the use of FWFPs to identify and manage onfarm risk to freshwater contamination, we oppose the dates for FEPs in Tables 8.6 and 9.5 for the following reasons:
 - a. FWFPs are not required to be prepared by these dates as part of the national roll-out, and we doubt the dates will be achievable in any case.
 - b. The highest priority for freshwater improvement should be urban catchments with a specific focus on improving *E.coli*.
- 84. Federated Farmers seeks relief that Tables 8.6 and 9.5 be removed from the proposed NRP, and that the timing for the nationally mandated FWFPs be as determined in the national rollout timeline.

Summary

- 85. Federated Farmers generally supports the long term (2100) overarching objectives of PC1.
- 86. However, we believe that the 2040 dates to achieve some of the TAS's are unrealistic and the Council must undertake more work to gather quality data to inform modelling used to underpin policy decisions. Freshwater action plans should be used to set realistic dates and determine appropriate measures to achieve the long-term objectives.
- 87. There are a number of proposed policies and rules in PC1 that will have severe consequences for some of our members. Federated Farmers believes these policies place undue burden on private property owners for, what is essentially a public good. Federated Farmers contend

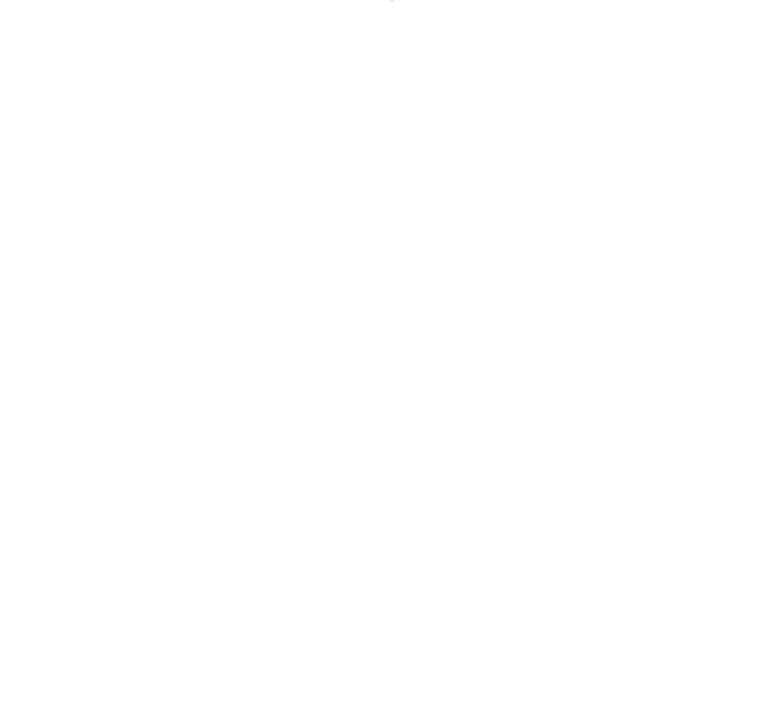

²¹ <u>Guidance-on-preparing-catchment-context-challenges-and-values-information.pdf (environment.govt.nz)</u>

that these policies should be removed, especially as the science underpinning them is not robust.

- 88. Federated Farmers reminds the Council that many policies and rules in the operative NRP have only recently been agreed through court assisted mediation (e.g. earthworks rules). We consider it too soon to start unravelling those agreed positions.
- 89. Federated Farmers support an integrated catchment approach to the management of sediment and nutrient loss, supported in tangible ways by the Council and underpinned by non-regulatory methods such as FAPs and a Regional Forest Spatial Plan.
